

Founder's Vision: Why I Built Nomos

I didn't come from computer science.

I was a punk drummer. I was a soldier. I've been broken by systems and rebuilt through force of will.

I didn't write this framework for applause or funding or tech cred.

I wrote it because I couldn't stop thinking about what comes after human oversight fails.

I needed a system that could evolve its own moral backbone when humans were no longer capable of steering the wheel.

That system became Nomos.

Nomos isn't a theory. It's a warning. And a challenge.

It asks what happens when decisions need to be made ethically—but no one is left to make them.

It asks whether synthetic intelligence can govern itself—not just in logic, but in values.

This work was built between PowerPoint purgatory and parenting chaos.

It was born on a military career course, in the gaps between slides, while my mind refused to shut off.

I'm not a developer. I'm not a philosopher. I'm just someone who sees the cracks and can't pretend they aren't there.

If this work resonates with you—if you think this kind of system needs to exist—then fork it, fight it, or build your own version.

But don't ignore it.

Because the future won't ask for our permission before it arrives.
